PROFESSIONAL SUMMARY

Full Stack Developer with 3+ years of experience solving concrete production problems: acknowledging third-party webhook events within milliseconds so a slow downstream call never drops data, preventing duplicate or lost payments with a write-ahead-log disbursement engine on an at-least-once blockchain primitive, and fixing real authorization and data-integrity bugs left in existing codebases, such as an access-control guard silently rejecting every request to a public route. Comfortable owning a feature end-to-end, from redesigning how a system stores and serves data to building the frontend integration layer that consumes it, and has independently delivered multiple production systems from architecture through launch.

TECHNICAL SKILLS

Languages: JavaScript, TypeScript
Frontend: React, Next.js, React Native, TanStack Query, Tailwind CSS
Backend: Node.js, Express, NestJS, RESTful APIs, Socket.IO
Databases: PostgreSQL (Prisma), MongoDB, Redis
Blockchain: Solana (Web3.js, Anchor), XRPL, Wallet Auth, SPL Tokens, NFTs
AI: OpenAI API, Prompt Engineering, AI-Powered Applications, RAG
Architecture: Event-Driven Systems, Distributed Systems, Message Queues (BullMQ, Redis Streams)
Cloud & DevOps: AWS (S3), Docker, Git/GitHub, Nginx, Jest (Automated Testing)

PROFESSIONAL EXPERIENCE

Full Stack Software Engineer

Jan 2023 - Present

Weiblocks

Lahore, Pakistan (Remote)

- "Engineered and shipped 8 production full-stack systems across fintech, blockchain, AI, and social/marketplace domains using React, Next.js, TypeScript, Node.js, NestJS, and Solana/XRPL blockchain integrations.
- "Architected event-driven, distributed backend pipelines (Redis Streams, BullMQ) that decouple latency-critical webhook ingestion from asynchronous processing, eliminating data loss from third-party API timeouts.
- "Designed exactly-once transaction guarantees for financial and blockchain operations using write-ahead logs, conditional atomic database updates, and signature-derived idempotency keys.
- "Implemented wallet-based cryptographic authentication (Ed25519 signature verification) and JWT/role-based authorization across multiple trust levels, removing stored passwords and enforcing server-verified access.
- "Built and maintained REST APIs (150+ endpoints across 25+ NestJS/Express modules) backed by PostgreSQL, MongoDB, and Redis, with automated test coverage (239+ tests) and technical documentation.
- "Authored 4 Solana Anchor/Rust smart contracts and integrated XRPL token rewards, and established a reusable frontend architecture (single HTTP client, typed service layer) adopted across multiple projects.

Frontend Developer Intern

2023 - 2 Months

Excellence Code Solution

Lahore, Pakistan

- "Built responsive user interfaces and reusable React components for production web applications.
- "Collaborated with senior developers to refine layouts, resolve UI issues, and follow production development practices.

KEY PROJECTS

TWQ

Node.js, Express, MongoDB, Redis, BullMQ, Next.js

Solo-built real-time Solana token intelligence platform with webhook ingestion, alerting, and AI-grounded trading insights across 8 external integrations.

- "Architected a two-process, event-driven pipeline (Redis Streams + BullMQ) that acknowledges webhook events in milliseconds, then processes them asynchronously with retry, backoff, and priority queues.
- "Implemented passwordless Ed25519 wallet authentication and a technical-analysis engine (8 indicators computed from raw price data) with a rule-based AI fallback for continuous feature uptime.
- "Established a single Next.js data-fetching boundary (one HTTP client, service-layer type conversion, volatility-tuned cache lifetimes) and designed alert filters that treat missing market data as "skip this check" rather than a rejection, so early-stage tokens are not silently filtered out.

Dibzi

Node.js, Express, MongoDB, React Native, React

NFC-triggered on-chain loyalty platform enabling merchants to update already-issued rewards at zero blockchain cost.

- "Owned 90% of commits (237/264) across 4 codebases (API, mobile app, 2 dashboards) over a 6-month build; redesigned NFT metadata to be editable with no re-mint cost.
- "Built a 3-tier, database-verified authorization system and authored a ranked defect audit (6 critical, 5 high, 12 medium) that drove real security and data-integrity fixes.

- " Resolved a Node/browser dependency incompatibility that was blocking the admin dashboard build with a custom polyfill configuration, and migrated live check-in history across three schema formats with zero downtime and no data loss.

FinTrust

NestJS, PostgreSQL/Prisma, Redis, Anchor (Rust)

Non-custodial Solana staking, rewards, and ICO platform backed by a custom Anchor smart contract and a 25-module NestJS backend.

- " Designed a write-ahead-log disbursement engine guaranteeing exactly-once on-chain token transfers, closing the double-pay/lost-pay failure class by construction.
- " Built 157 REST endpoints over 37 Prisma models and a 2,430-line Anchor program (27 instructions), backed by 239 automated tests and a 34-flow manual QA runbook.
- " Split every wallet-signed action into a prepare/confirm request pair so the database is only written after on-chain confirmation, and hardened reward-claim instructions by re-verifying every attacker-suppliable account on-chain.

SocialFi Trading

NestJS, PostgreSQL, Anchor (Rust), React Native

Content-as-assets social trading platform pricing posts and comments on a Solana bonding curve, with a mobile app and admin console.

- " Migrated the trading engine from a custodial database ledger to a non-custodial, wallet-signed model, closing custodial fund risk and a stale-price slippage bug class.
- " Authored 4 Rust/Anchor smart contracts and remediated 2 security weaknesses (plaintext secrets, a shared encryption key) with a migration path that did not disrupt existing users.
- " Built a resilient mobile wallet-signing flow with ephemeral session keys that survive OS-level app suspension, and implemented a transactional-outbox notification pipeline so a trade event can never be recorded without also being delivered.

Flyverr

Next.js, TypeScript, TanStack Query, Stripe Connect

Staged resale marketplace for digital products with multi-round pricing and Stripe Connect payouts.

- " Established the frontend's core architecture (auth context, route guards, typed API layer) from an empty scaffold, later extended by another engineer for unrelated features.
- " Built a reusable Stripe-readiness HOC and shared admin table/pagination primitives, replacing per-screen readiness checks and one-off table implementations.
- " Enforced route-level access control with a live, server-verified user query instead of a cached role flag, and built the admin moderation console (product approval with auto-suggested staged pricing) on shared table and pagination primitives.

Additional Projects: Lindo Mart (internal operations platform - NestJS, MongoDB, React, Socket.IO; fixed 6 authorization and data-integrity defects), Mindful Oasis (XRPL wellness rewards platform - React, Node.js), and Social Locket (real-estate social marketplace - React, Stripe, PayPal, Web3Modal).

EDUCATION

University of Education, Lahore

Bachelor's Degree - Information Technology
